PERINATAL HEPATITIS B PREVENTION PROGRAM

Program Overview from a Case Management Perspective

Deborah Snaman, RN, BSN
Assistant Director, Immunization Services
Quality Assurance Manager
Perinatal Hepatitis B Prevention Program Coordinator

2015 Regional Training for Local Health Departments and Regional Epidemiologists
Objectives

By the end of this session, participants will be able to:

- Identify, report, and manage hepatitis B surface antigen (HBsAg) positive pregnant women and their infants to ensure appropriate newborn post exposure prophylaxis (PEP) is received.

- Describe completion of the hepatitis B virus (HBV) vaccination series for affected infant, as well as appropriate post vaccination serology testing (PVST).

- Understand the case management requirements of the state and local health department (LHD).
Perinatal Hepatitis B Prevention Program (PHBPP) was established in 1990.

It is funded by Section 317 of the federally funded immunization grant.

2013 – 2017 is the current funding cycle.

Program works closely with the Centers for Disease Control and Prevention (CDC), Division of Viral Hepatitis (DVH).

DVH worked on Advisory Committee of Immunization Practices (ACIP) recommendations that are used to frame the program today.
A Comprehensive Immunization Strategy to Eliminate Transmission of Hepatitis B Virus Infection in the United States

Recommendations of the Advisory Committee on Immunization Practices (ACIP)
Part 1: Immunization of Infants, Children, and Adolescents

INSIDE: Continuing Education Examination
Program Objectives for Current Funding Cycle

- Identify infected HBsAg positive pregnant women.

- Ensure PEP for infants by administering Hepatitis B Immune Globulin (HBIG) and birth dose of HBV vaccine within 12 hours of delivery.

- Ensure completion of HBV vaccine series, along with PVST.

- This approach shown to be 85% – 95% effective in preventing mother to child transmission (MTCT).
What is Hepatitis B?

- A contagious liver disease caused by an infection with hepatitis B virus.
- It can lead to chronic, lifelong illness capable of causing serious health problems.
- 15% – 25% of those with chronic infections develop serious liver problems:
  - Chronic hepatitis
  - Cirrhosis
  - Liver failure
  - Liver cancer
• HBV is spread through contact with blood and body fluids of an infected person.

• Various possibilities for exposure:
  • Of particular importance – BIRTH – spread from infected mothers.
  • Intrapartum most common route of MTCT via:
    • Mirco-transfusion or hematologic leaks of the mother’s blood to the fetus during contractions.
    • Inoculation of fetal mucus membranes or breaks in the skin (scalp electrodes).
At Risk Infants

Without PEP:

- Mother positive for HBsAg and hepatitis B e antigen (HBeAg):
  - Infant has 70% – 90% chance of becoming infected.
  - 90% of infected infants become chronically infected.

- Mother positive for HBsAg only:
  - Infant has 10% chance of becoming infected.
  - 90% of infected infants become chronically infected.

- Prevention is our focus.

Commission for Case Management Certification defines case management as:

- Case management is a collaborative process that assesses, plans, implements, coordinates, monitors, and evaluates the options and services required to meet the client’s health and human service needs. It is characterized by advocacy, communication, and resource management; and promotes quality and cost-effective interventions and outcomes.

Source: http://ccmcertification.org
Perinatal Hepatitis B Definition

- HBsAg positivity in an infant from birth through 24 months of age who was born in the United States (US) or US territories to an HBsAg positive mother.

- Definition helps us to better understand some of the program’s requirements and reporting time frames.

- Identifies why the program and case management efforts focus on the infant’s first 1 – 2 years of life.
Case Management Efforts of PHBPP

Connects with four program objectives:

- Identification of HBsAg positive pregnant women.
- Assuring infants born to HBsAg positive women obtain timely and appropriate PEP at birth and complete the HBV vaccine series.
- Infant receives PVST to identify if the infant is protected, infected, or still susceptible to the HBV.
Case Management Requirements - State

- Oversee and ensure grant requirements are met (PHBPP efforts are federally funded).

- Liaison between local and federal government.

- Available for consultation and case management assistance with LHD and providers.

- Track, monitor, and report local case management efforts to CDC via mid-year and annual report.
Establish a mechanism to identify all HBsAg positive pregnant women.

Conduct case management of all identified infants at risk of acquiring perinatal HBV infection, which includes:

- administration of appropriate immunoprophylaxis to all infants born to HBsAg positive women (including HBIG, HBV vaccine birth dose, and complete vaccine series); and
- completion of PVST of all infants born to HBsAg positive women and reporting all HBsAg positive infants to CDC.
Grant Requirements (Continued)

- Evaluate completeness of identification of HBsAg positive pregnant women, case management, reporting of HBsAg positive infants, and appropriate care of infants born to mothers of unknown HBsAg status, based on methodology provided by CDC.

- Develop and examine feasibility to implement a state plan to put into practice a universal reporting mechanism with documentation of maternal HBsAg results for all births.

- Work with hospitals to achieve universal birth dose coverage and documentation of the birth dose in an immunization information system (IIS).
- Conduct case management of infants at risk of acquiring perinatal HBV.

- Track, monitor, report HBlG, HBV vaccine series, and PVST to State PHBPP Coordinator.

- Protection of at risk infant program goal – team effort, cannot do it alone.

- LHD has better connection to the local providers as well as the mothers of these infants.
When Does Case Management Begin?

- Receipt of HBsAg positive lab.

- Follow hepatitis B surveillance protocol in West Virginia Division of Infectious Disease Epidemiology (DIDE) manual including:
  
  - Contact client’s physician.
  
  - Determine pregnancy status.
  
  - Determine educational needs of client.
• Inform physician of case management requirements, reinforce joint effort, protection of baby a priority.

• Report to Perinatal Hepatitis B Prevention Coordinator and Division of Infectious Disease Epidemiology.
All hepatitis B acute, chronic, and perinatal cases must be reported by health care providers and facilities \textit{within 24 hours} to your LHD. (WV CODE 16-3-1; 64CSR7)

\textbf{State Contacts}

\textbf{Acute/Chronic}: Division of Infectious Disease Epidemiology  
(800) 423-1271 or (304) 558-5358, Extension 1

\textbf{Perinatal}: Division of Immunization Services  
(800) 642-3634 or (304) 558-2188
Contact client, educate or reinforce physician’s educational efforts.

Pregnant – stress HBIG, HBV vaccine series – timing and completion, and PVST.

Possible Right From The Start (RFTS) referral via alternate entry – RFTS can assist with case management, discuss benefits of program with client.
- Notify birthing facility – infectious disease personnel.

- Touch base with woman 1 - 2 time(s) during pregnancy – reinforce HBIG, vaccine series, and PVST.

- Contact birthing facility 1 - 1 ½ months prior to expected delivery date as a reminder of upcoming birth (keep in mind, may deliver early).

- Send Initial Report Delivery Form to delivery hospital.
- Upon delivery, birthing facility should provide the LHD with Initial Report Delivery Form detailing:
  - Infant’s date and time of birth, and birth weight
  - Date and time of HBIG
  - Date and time of HBV vaccine
  - Pediatrician’s name and phone number

- Notification of birth within 3 days of delivery. *(LHD to State Perinatal Hepatitis B Prevention Coordinator)*
Perinatal Hepatitis B Prevention: Initial Report & Delivery Form

Date of Report: ____________________________  County: ____________________________

Name of Person Completing Report: ____________________________  Phone: ____________________________

Mother’s Name: ____________________________  Mother’s Date of Birth: ____________________________

Mother’s Address: ____________________________  City, State: ____________________________

Zip Code: ____________________________  Insurance: ____________________________

Asian/Pacific Islander  American Indian/Alaskan Native  American Indian/Alaskan Native  Hispanic  White  African American  Other: ____________________________

Mother’s Race: ____________________________  Mother’s Birth Country: ____________________________

Mother’s Hepatitis B Surface Antigen Test Results: ____________________________

Date: ____________________________  HBsAg Positive: Yes: ____________________________  No: ____________________________

Name of Conducting Lab: ____________________________

Was testing completed/repeated at time of delivery: Yes: ____________________________  No: ____________________________

Please fax a copy of the original lab results with this form.

OB Provider: ____________________________  Phone: ____________________________

Date of Birth: ____________________________  Time of Birth: ____________________________

Sex: Male: ____________________________  Female: ____________________________

Infant’s Name: ____________________________

Infant’s Birth Weight: ____________________________

Delivery Hospital: ____________________________  Phone: ____________________________

Prophylaxis: ____________________________

HBIG Given: Yes: ____________________________  No: ____________________________

Hepatitis B Given: Yes: ____________________________  No: ____________________________

Date Given: ____________________________  Time: ____________________________

If no, please state reason: ____________________________

HBIG and Hepatitis B #1 should be given within 12 hours of birth.

Pediatrician: ____________________________  Phone: ____________________________

PLEASE COMPLETE AND FAX THIS FORM TO: ____________________________

(304) 558-6335  ATTN: Perinatal Hepatitis B Prevention Coordinator

Division of Immunization Services

This form provides the means for us to initiate the tracking of an infant born to an HBsAg positive mother through the completion of the Hepatitis B series and post vaccination serological testing. Local Health Department, please fax a copy of this form to the birthing facility’s infection control nurse and/or obstetricians floor to be completed.

August 2014
Contact pediatrician:

- Ensure pediatrician is aware of birth mother’s hepatitis B positive status.

- Discuss LHD case management efforts.

- Review PHBPP efforts to ensure HBV vaccine doses are completed on schedule, reported to the West Virginia Statewide Immunization Information System (SIIS), and followed by PVST.
Review Perinatal Hepatitis B Prevention: Pediatrician Form with provider and send copy.

Stress importance of completion and reporting to LHD following each step.

Offer to send provider Perinatal Hepatitis B Prevention flyer outlining vaccine, PVST, tests to order, and interpretation values.
Case management efforts can continue through 18 months; rare occasion may last until infant is 24 months of age.

Ongoing contact keeps needs of infant in the forefront:
- Ideal to contact mother and pediatrician approximately 2 weeks prior to next vaccine due date.
- Review updating pediatrician form with provider, stressing importance of faxing form to the LHD after each additional update.
- LHD to fax updated form to Perinatal Hepatitis B Prevention Coordinator.
- Continue to follow through PVST.

<td>Post Vaccination Serological Testing Hepatitis B Surface Antigen (HBsAg) AND Antibody to Hepatitis B Surface Antigen (Anti-HBs)</td>
</tr>
</tbody>
</table>

* Preterm infants weighing less than 2,000 grams (4.4 lbs.) at birth should receive HBIG and HBV within 12 hours of delivery and an additional 3 doses of hepatitis B vaccine, as the birth dose is not counted as part of the vaccine series.
Understanding the Vaccine and PVST Timeframe

- Recommended age for interventions follow the recommended timeframe of the ACIP immunization schedule which parallels the routine well-child exam.

- Two pronged approach – similar to Vaccines for Children (VFC) Program (age and insurance). This is age and intervention. PVST is spaced from last dose of vaccine AND age of child.

- Understanding perinatal hepatitis B definition helps us understand why the work of the PHBPP focuses its efforts during an infant’s first 1 – 2 years of life.

- Age of diagnosis is one of the criteria for an infant with HBsAg positivity being reported and counted as a perinatal hepatitis B case.

<td>Anti-HBs: Negative</td>
</tr>
</tbody>
</table>

Infants who are protected will need no further medical management.

Infants who remain susceptible should be revaccinated with a second 3-dose series and retested 1 – 2 months after the final dose.

Infants who are positive should be referred for medical evaluation and management of chronic Hepatitis B.
An infant is born in the United States to a HBsAg positive mother. The post vaccine serological testing was performed when the infant was 35 months of age. The results show:

- HBsAg: Positive
- Anti-HBs: Negative

**QUESTION:**
Is this child infected with hepatitis B?

**YES.**

**QUESTION:**
Would this child meet the case definition for perinatal hepatitis B?

**NO, because of the timing of the test. HBsAg positivity for perinatal hepatitis B diagnosis is > 1 – 24 months of age.**
Challenges – Local Health

- Despite best efforts – some will be lost to follow-up.
- Don’t give up quickly.
- Work with other agencies in your community (RFTS).
- Conduct a home visit.
- Offer services at LHD:
  - If no show with pediatrician, offer vaccines at LHD.
  - Possible PVST at LHD (contact us prior to this to ensure State Lab is aware of specimen; prevents LHD from being charged).
A non-compliant parent (missing appointments, infant missing HBV vaccine, PVST not obtained) could show aspects of neglect or abuse.

If so, as a mandatory reporter, a referral to CPS may be warranted:

WEST VIRGINIA CODE (excerpt)
(a) Any medical, dental or mental health professional, Christian Science practitioner, religious healer, school teacher or other school personnel, social service worker, child care or foster care worker, emergency medical services personnel, peace officer or law-enforcement official, humane officer, member of the clergy, circuit court judge, family court judge, employee of the Division of Juvenile Services, magistrate, youth camp administrator or counselor, employee, coach or volunteer of an entity that provides organized activities for children, or commercial film or photographic print processor who has reasonable cause to suspect that a child is neglected or abused or observes the child being subjected to conditions that are likely to result in abuse or neglect shall immediately, and not more than forty-eight hours after suspecting this abuse or neglect, report the circumstances or cause a report to be made to the Department of Health and Human Resources: Provided, That in any case where the reporter believes that the child suffered serious physical abuse or sexual abuse or sexual assault, the reporter shall also immediately report, or cause a report to be made, to the State Police and any law-enforcement agency having jurisdiction to investigate the complaint: Provided, however, That any person required to report under this article who is a member of the staff or volunteer of a public or private institution, school, entity that provides organized activities for children, facility or agency shall also immediately notify the person in charge of the institution, school, entity that provides organized activities for children, facility or agency, or a designated agent thereof, who may supplement the report or cause an additional report to be made.
Challenges – State

- Pediatrician unaware of mother’s HBsAg positive status
- Delay of vaccines or PVST
- PVST performed too soon
- Wrong test ordered
Why wait until the infant is 9 months or older?

- Earlier testing may detect anti-HBs from HBIG and not the vaccine. HBIG protection can last from 3 – 6 months.

Why is it necessary to wait 1 – 2 months after the last dose of vaccine before testing?

- Testing performed before 1 month (4 weeks) may result in a false positive HBsAg.
- Optimal time for detecting protective antibodies is 1 – 2 months after the final dose of HBV – at 9 months of age.
Can testing wait until the infant is older?

- 9 – 12 months follows the established schedule associated with well-child exams and the immunization schedule.

- Timeframe is after the recommended completion date of the HBV vaccine series.

- Anti-HBs levels decline rapidly in the first year of life.

- Delays in testing can miss the peak anti-HBs level as well as the level defined as protection (≥ 10mIU/ml).
Additional Challenges – State

- Confusion over when and where to report – LHD or directly to State PHBPP Coordinator.
  - Forms are prepared for LHD to fax to State.
  - Sometimes physician sends forms to State.
  - If so, we will contact the LHD with updated information.

- Incomplete forms – often insurance status missing. Insurance information is needed for mom and baby.

**Bottom line: We need you!**

*You are the direct link between mom, baby, physicians and State.*
