This analysis is supported by the Health Resources and Services Administration (HRSA) of the U.S. Department of Health and Human Services (HHS) under grant number B04MC47454, Maternal and Child Health Services. The information, content and/or conclusions are those of the author(s) and should not be construed as the official position or policy of, nor should any endorsements be inferred by HRSA, HHS, or the U.S. Government.

As of January 1, 2024, the West Virginia Department of Health and Human Resources (DHHR) officially reorganized into three separate departments. The West Virginia Department of Health (DH) is one of those departments. Any reference of DHHR and DH throughout the report are one in the same.

Executive Summary

Like other states, the COVID-19 pandemic had an adverse impact on primary, preventive, and mental health services for West Virginia children and youth in 2021. Overall, 29.9% (95% CI, 21.6%-38.2%) of West Virginia households with children reported that ≥ 1 child or adolescent had missed, skipped, or delayed preventive checkups in the last 12 months because of COVID-19.¹

West Virginia had more than 197,412 Medicaid members aged 0-20, including 96,149 who received Early and Periodic Screening, Diagnosis, and Treatment (EPSDT) “well-child” exams in 2022. The mental health of these children and youth is a priority of the West Virginia Department of Health (DH). To continue serving this population, an analysis was conducted to determine how often mental health screening was performed during EPSDT visits. The analysis involved standardized medical record reviews of age and a geographically representative sample of 1,294 EPSDT exam records.

A mental health screening was determined to have been completed if responses were recorded from standard trauma screening, i.e., the abbreviated (two-question) Post-Traumatic Stress Disorder Checklist – Civilian Version (PCL-C); if developmental surveillance² included two or more social determinants of health; or if responses were recorded from a depression screening, i.e., the Patient Health Questionnaire-2 (PHQ-2). In this sample, 82.5% of EPSDT exam records included mental health screening compared to 79.5% in 2020 and 83.3% in 2021. The prevalence of mental health screening varied by HealthCheck region and according to documentation format. A higher prevalence of mental health screening among providers using age-appropriate HealthCheck Preventive Health Screen (PHS) forms suggests that increasing utilization of these forms could enhance statewide mental health screening in this critical population.

Background

The Office of Maternal, Child and Family Health (OMCFH), within the DH’s Bureau for Public Health, is West Virginia’s Title V Maternal and Child Health Agency and is responsible for the utilization of funds provided by the Maternal and Child Health Block grant of Title V of the Social Security Act of 1935, 42 U.S.C. §701 *et seq.* Consistent with federal policy that requires state Medicaid agencies to coordinate with Title V grantees; OMCFH provides administrative oversight for the State’s EPSDT Program, i.e., HealthCheck. To ensure EPSDT services are provided in accordance with reasonable standards of medical and dental practice, the HealthCheck Program makes use of the American Academy of Pediatrics’ *Bright Futures: Guidelines for Health Supervision of Infants, Children, and Adolescents* to inform the development of policy, procedures, and age-appropriate HealthCheck preventive health screening (PHS) forms available (free of

² Developmental surveillance is a continuous and cumulative process through which potential risk factors for developmental disorders can be identified. The components of developmental surveillance include eliciting and attending to parental concerns, documenting and maintaining a developmental history, making accurate observations of the child, identifying the presence of risk and protective factors, and maintaining an accurate record by documenting the process and findings. Developmental surveillance is required at every initial and periodic visit when a standard screening tool is not completed. The concerns of both parent/caregiver and primary care provider should be included in determining whether surveillance suggests the child may be at risk of developmental delay (West Virginia HealthCheck Provider Manual. Retrieved December 29, 2021, from <https://dhhr.wv.gov/HealthCheck/providerinfo/Pages/ProviderManual.aspx>).

charge) to all health care providers who see children/youth 0-20 years of age.³ The HealthCheck standard of care promotes psychosocial/behavioral screening at each EPSDT exam from birth through age 20. Said psychosocial/behavioral screening should address “social and emotional health, caretaker depression, and social determinants of health.”⁴ In West Virginia, EPSDT exams may be documented on the age-appropriate HealthCheck PHS form, in the provider’s electronic medical record (EMR) or electronic health record (EHR), or within a paper-based record stored on paper-based mediums.

The HealthCheck Program regularly conducts quality improvement initiatives, small-scale cycles of interventions that are linked to assessment, with the goal of improving the process, outcome, and efficiency of the systems of pediatric health care in West Virginia. To link the quality improvement cycle of intervention to the assessment, medical record audits are completed to rate quality – how often and how well something is being done (or not done). This quality-improvement approach has proven to be the most efficient means of building surveillance and screening elements into the process of care in pediatric offices.⁵ Medical record reviews are critical to the quality improvement cycle, as the results of the reviews are used to develop improvement strategies.⁶

In May 2019, the West Virginia Department of Health and Human Resources entered into a Memorandum of Understanding (MOU) with the U.S. Department of Justice to address West Virginia’s child welfare system and to ensure children who require mental health services can receive them in their homes and communities by ensuring appropriate placement in residential mental health treatment facilities and expanding community-based mental health services. Pursuant to MOU requirements, an Implementation Plan was developed to describe actions to be taken to ensure MOU rubrics were utilized to reform West Virginia’s children’s mental health system. Correspondingly, OMCFH was tasked with 1) identifying gaps in the EPSDT screening process, specifically psychosocial/behavioral screening (aka mental health screening) for children/youth who have Medicaid, and 2) modifying practice, as needed, to ensure adherence to MOU goals.

To accomplish this task, a hybrid quality measure (claims data and clinical data from individual medical records) was developed, and OMCFH evaluated the extent to which mental health screening took place during EPSDT exams that were conducted during the calendar year 2019 for Medicaid members ages 6-18.⁷

In response to feedback from subject matter experts, the sample populations for subsequent retrospective analyses were modified to include all Medicaid members aged 0-20 years. The authors debated how best to assess mental health in children 0-5 years old. Recognizing that

³ The HealthCheck PHS forms operationalize the American Academy of Pediatrics *Bright Futures* guidance for comprehensive well-child exams. Providers must meet this standard but are not required to utilize the forms. See <https://dhhr.wv.gov/HealthCheck/providerinfo/Pages/default.aspx>.

primary care providers are among the first professionals with whom parents will discuss concerns regarding their child’s behaviors, developmental surveillance with a specific inquiry regarding social determinants of health was included to assess mental health screening in the 0-5-years-old population.⁸ The same methodology from calendar year 2020 and 2021 was utilized for 2022.

Methodology

In December 2022, Medicaid members aged 0-20 years totaled 197,412. Among these, administrative claims data indicated 96,149 children and youth had received an EPSDT exam, i.e., a comprehensive preventive medical exam, in calendar year 2022. A random sample of patients with a corresponding claim for a comprehensive preventive medical service was selected for review. Comprehensive preventive medicine services (well-child care) were identified using the Current Procedural Terminology (CPT) and International Classification of Diseases, 10th Revision, Clinical Modification (ICD-10-CM) codes found in Appendix A.

Medical records were requested from the health care providers of 1,500 of 96,149 Medicaid-eligible children and youth, ages 0-20, who received an EPSDT exam in calendar year 2022. A total of 1,301 records were obtained and 1,297 were reviewed. Incomplete records, either for the wrong date of service or another visit type, were excluded, and 1,294 records met the final inclusion criteria of being for a well-child exam.

To address varied forms of documentation, a standardized medical record review process, and data collection tool were developed to assess whether a child was screened for mental health conditions during his/her EPSDT exam. Four professional Registered Nurses (RNs) received training on the quality hybrid measure and the use of the standardized data collection tool before completing a review of medical records from the sample population described above. For the purposes of this analysis, a “mental health screening” was defined to have occurred if a review of the medical record documented one of the following measures from the HealthCheck standard of care:

- Abbreviated (two-question) PTSD Checklist - Civilian version (PCL-C);⁹
- Developmental surveillance inclusive of no less than two of eight social determinants of health (SDOH) – a) economic stability, b) education and development, c) health and health care, d) neighborhood and built environment, e) social and community context, f) family relationships, g) peer relationships, and h) stress;
- Patient Health Questionnaire-2 (PHQ-2), a two-item depression screening scale;¹⁰ and/or
- Baby Pediatric Symptoms Checklist;¹¹ and/or
- Other validated social-emotional screening tools.

See Appendices B and C for the Medical Record Review Tool and Algorithm.

To surmise the incidence of referral because of mental health screening, claims for mental and behavioral health services that occurred within 90 days from the data of the EPSDT exam were identified. See Appendix D for CPT codes used to identify mental and behavioral health services.

Results

The sample was similar to the population in age, foster care status, and location of provider by HealthCheck region (Table 1). Both the sample and the population had a similar mean age, 7.6 and 7.9 years of age respectively. Similarly, 3.3% of the sample was in foster care at some point before December 31, 2022, compared to 2.9% of the population. The sample had a slightly larger proportion of records than the population in HealthCheck regions 3, 4, 6, and 7, a lower proportion in the other HealthCheck regions, with an equal proportion of out-of-state records.

Table 1. Characteristics of the Sample and Population, 2022

Category		Sample (n = 1,294)		Population (n = 96,149)	
		Mean		Mean	
Age		7.6		7.9	
Category		n	%	n	%
Foster care status	Yes	43	3.3%	2,755	2.9%
	No	1,251	96.7%	93,394	97.1%
HealthCheck Region	1	124	9.6%	12,318	12.8%
	2	155	12.0%	12,956	13.5%
	3	258	19.9%	18,587	19.3%
	4	127	9.8%	8,478	8.8%
	5	94	7.3%	7,147	7.4%
	6	94	7.3%	5,537	5.8%
	7	219	16.9%	14,592	15.2%
	8	87	6.7%	6,406	6.7%
	9	126	9.7%	9,380	9.8%
Out of state		10	0.8%	748	0.8%

Of the 1,294 EPSDT exams reviewed, 82.5% met the standard for a mental health screening (Table 2). Based on a post-hoc power calculation, this estimate lies within 3% of the population prevalence with 98% confidence. Among those screened, the most common screening method was developmental surveillance/SDOH (77.9%), followed by depression screening (11.7%), trauma (8.7%), and other social-emotional tools (1.4%), and the Baby Pediatric Symptoms Checklist (0.3%). It is important to note that screening types were only assessed as age-appropriate. As such, not all methods were assessed for all children. The Medical Record Review Algorithm (Appendix C) determines the age-appropriate hierarchy of screening methods; the first confirmed screening method is reflected in Table 2.

While only 10.7% of EPSDT exams used the PHS form, all but five records received on a PHS form (96.4%) demonstrated a mental health screening, compared to 80.9% of records reported from electronic medical records or paper charts (Table 2).

Of 226 children and youth who did not receive a documented mental health screening at their EPSDT exam, six (2.7%) were already receiving mental health services according to their EPSDT exam record.

Table 2. EPSDT Exams Included Mental Health Screening, 2022

Screening Method	PHS form		EMR/paper		Total	
	n	%	n	%	n	%
Screened	133	96.4%	935	80.9%	1,068	82.5%
<i>Trauma</i>	49	36.8%	44	4.7%	93	8.7%
<i>Developmental Surveillance/SDOH</i>	78	58.6%	754	80.6%	832	77.9%
<i>Depression</i>	5	3.8%	120	12.8%	125	11.7%
<i>Other social-emotional tool</i>	1	0.8%	14	1.5%	15	1.4%
<i>Baby Pediatric Symptoms Checklist</i>	0	0.0%	3	0.3%	3	0.3%
Not Screened	5	3.6%	221	19.1%	226	17.5%
Total	138	10.7%	1,156	89.3%	1,294	100%

The use of the HealthCheck PHS form varied by HealthCheck region, ranging from 1.1% in regions 6 to 48.3% in region 8 (Table 3). See Appendix E for a map of the HealthCheck regions.

Table 3. EPSDT Exam Documentation Type by HealthCheck Region, 2022

HealthCheck Region	HealthCheck PHS form		EMR/paper		Total
	n	%	n	%	
1	16	12.9%	108	87.1%	124
2	7	4.5%	148	95.5%	155
3	22	8.5%	236	91.5%	258
4	2	1.6%	125	98.4%	127
5	12	12.8%	82	87.2%	94
6	1	1.1%	93	98.9%	94
7	6	2.7%	213	97.3%	219
8	42	48.3%	45	51.7%	87
9	23	18.3%	103	81.7%	126
Out of state	7	70.0%	3	30.0%	10
Total	138	10.7%	1,156	89.3%	1,294

Variation in mental health screening by HealthCheck region (Table 4, Figure 1, and Figure 2) was noted. Screening rates were lowest in region 2 (70.3%) and highest in region 8 (95.4%). Region 2 has demonstrated a decreasing screening rate since the onset of these reviews in 2019. Region 8's screening rates remain consistently higher than other region year after year. It is interesting to note, region 8 also had the highest rate of PHS form utilization and the highest screening rate. Conversely, regions 2 and 6 demonstrated relatively low utilization of the PHS form in the sample and had below average screening rates. However, this trend is not universal across all HealthCheck regions (i.e. regions 4 and 7).

Table 4. Screening by HealthCheck Region, 2019 – 2022

HealthCheck Region	2019	2020	2021	2022
1	90.3%	81.6%	85.9%	84.7%
2	81.2%	76.4%	74.2%	70.3%
3	85.9%	83.1%	87.6%	81.0%
4	88.3%	82.8%	92.8%	91.3%
5	86.5%	68.2%	73.8%	73.4%
6	75.6%	71.4%	87.8%	79.8%
7	78.0%	79.6%	89.9%	85.4%
8	92.0%	95.3%	90.7%	95.4%
9	75.9%	86.0%	84.7%	83.3%
Out of state	64.7%	69.6%	56.6%	100.0%
Total	82.3%	79.5%	83.3%	82.5%

Figure 1. Map of Screening Rates by HealthCheck Region, 2022

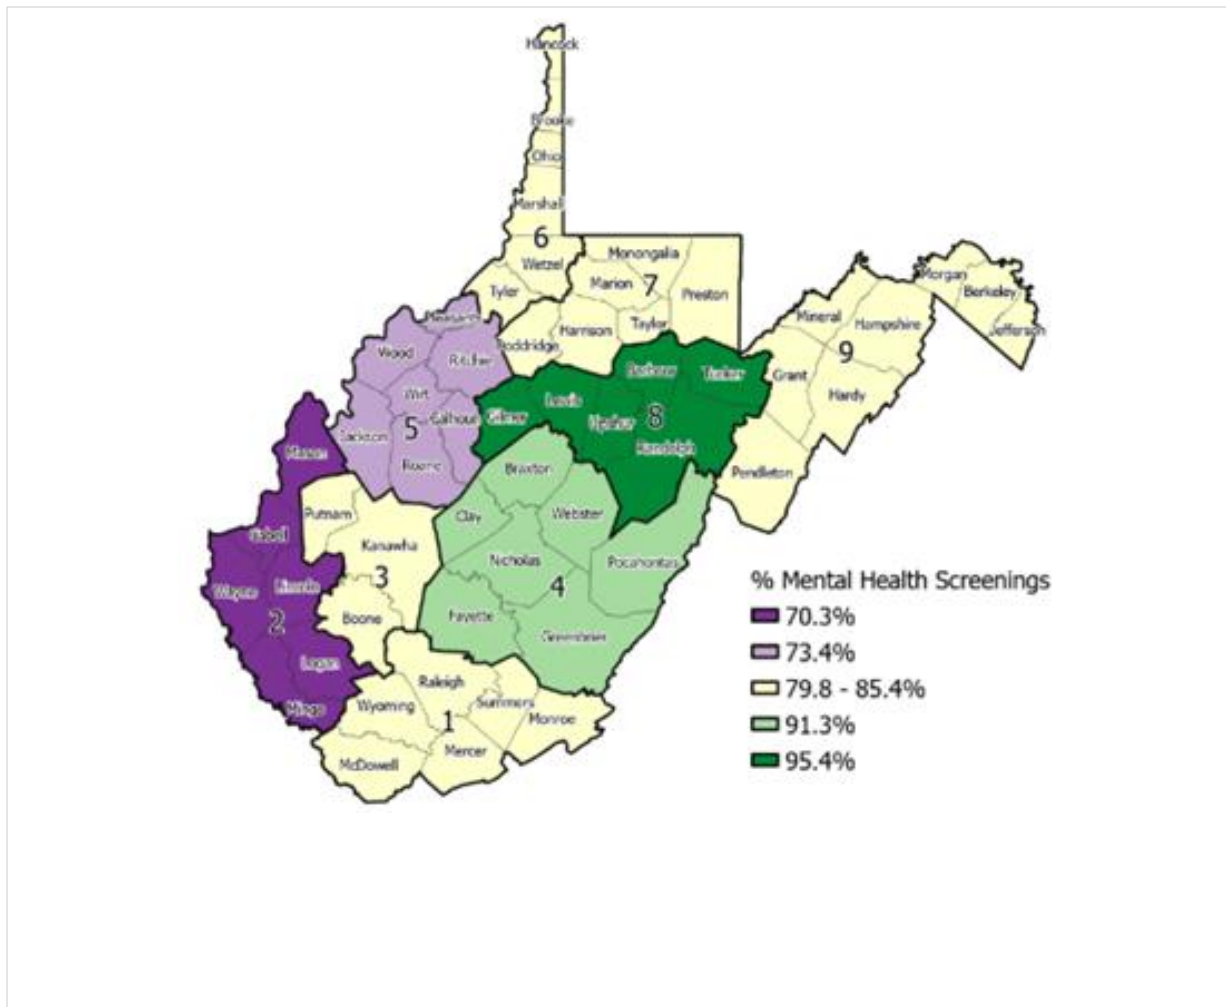

Figure 2. Screening by HealthCheck Region, 2019-2022

Consistent with previous years’ reviews, screening rates increase with age. As with last year, there was a slight decrease in the 19-20-year-old population; however, this should be evaluated with caution due to this population’s small sample size. Seventy-five percent (74.9%) of 0-5-year-old children received a mental health screening compared to 89.4% of 9-18-year-olds and 80.0% of 19-20-year-olds (Table 5).

Table 5. Screening by Age Group, 2019-2022

Age Group	Screened		Not Screened		Total
	n	%	n	%	
2019					
6-8 years old	160	79.6%	41	20.4%	201
9-18 years old	427	83.4%	85	16.6%	512
Total	587	82.3%	126	17.7%	713
2020					
0-5 years old	264	70.2%	112	29.8%	376
6-8 years old	84	80.8%	20	19.2%	104
9-18 years old	271	90.3%	29	9.7%	300

Age Group	Screened		Not Screened		Total
	n	%	n	%	
19-20 years old	10	90.9%	1	9.1%	11
Total	629	79.5%	162	20.5%	791
2021					
0-5 years old	268	76.4%	83	23.6%	351
6-8 years old	96	81.4%	22	18.6%	118
9-18 years old	308	91.4%	29	8.6%	337
19-20 years old	6	85.7%	1	14.3%	7
Total	678	83.4%	135	16.6%	813
2022					
0-5 years old	405	74.9%	136	25.1%	541
6-8 years old	157	84.4%	29	15.6%	186
9-18 years old	498	89.4%	59	10.6%	557
19-20 years old	8	80.0%	2	20.0%	10
Total	1,068	82.5%	226	17.5%	1,294

A mental or behavioral health claim within 90 days of the EPSDT exam was noted for 451 (42.2%) of the 1,068 children and youth who received mental health screening during their EPSDT exam, thus suggesting referral for treatment – as reported in Element 11 of the CMS-416: Annual EPSDT Participation Report (Table 6). This is an increase from last year’s review (34.7%). The majority of these mental or behavioral health claims were for developmental screening. More than 45% of the mental or behavioral health claims within 90 days of the EPSDT exam were for children between ages 0-5 years (Table 7).

Table 6. Children Who Received Mental/Behavioral Health Services Within 90 Days of Well-Child Exam by Age, 2022

Age group	Received mental/behavioral health services		Received mental health screening
	n	%	n
0 years old	41	41.8%	98
1 year old	38	64.4%	59
2 years old	52	74.3%	70
3 years old	22	84.6%	26
4 years old	27	36.5%	74
5 years old	27	34.6%	78
6-8 years old	39	24.8%	157
9-18 years old	205	41.2%	498
19-20 years old	0	0%	8
Total	451	42.2%	1,068

Table 7. Mental Behavioral Health Services Received Within 90 days of Well-Child Exam, 2022

Procedure	CPT/HCPCS	Count
Developmental testing	96110	279
Behavioral assessment	96127	133
Office or other outpatient visit for the evaluation and management of a new patient	99204	27
Individual psychotherapy services, 30 minutes	90832	17
Individual psychotherapy services, 60 minutes	90837	13
Psychotherapy, 45 minutes	90834	12
Mental health assessment	H0031	11
Psychiatric diagnostic evaluations without medical services	90791	7
Psychiatric Diagnosis Interview Examination (PDE)	90792	7
Family psychotherapy (without the patient present), 50 minutes	90846	2
Group psychotherapy (other than of a multiple-family group)	90853	1
Psychological and neuropsychological testing and interpretation, 1 st hour	96130	1
Psychological and neuropsychological testing and interpretation, additional hour	96131	1
Psychological or neuropsychological test administration/scoring, 1 st 30 minutes	96136	1
Psychological or neuropsychological test administration/scoring, additional 30 minutes	96137	1

Children can be counted multiple times if they received multiple unique services after a well-child exam.

Discussion and Recommendation

This analysis indicates that 82.5% of Medicaid members, ages 0-20 years, received a mental health screening at an EPSDT exam completed in calendar year 2022. Last year’s review suggested the emergence of an increasing trend in rates of mental health screening: 82.3% in 2019 claims*, 79.5% in 2020 claims, and 83.3% in 2021 claims. Considering the positive correlation of mental health screening with age, a decrease in screening rates in 2020 was expected. However, this year’s mental health screening rate, while consistent with the 2021 rate, does not confirm this increasing trend. This year’s review again demonstrates that utilization of HealthCheck’s PHS form is associated with higher mental health screening rates; however, this trend is not universal across all HealthCheck regions. For example, regions 4 and 7 have relatively low PHS form utilization and higher than average mental health screening rates. In fact, region 4 has the second highest rate of mental health screening. The PHS form is meant to set the standard for what must be addressed at a well-child exam and is not required to be used. This suggests the providers in these regions have incorporated the PHS form standards into their EHR or paper charting systems. Mental health screening rates were consistent across regions compared to previous year’s.

*Review consisted of members 6-18 years of age.

The data presented here continues to provide opportunities for engagement with the medical community for quality improvement. Regional differences in HealthCheck PHS form use and other mental health screening tools could be addressed by regional HealthCheck Program Specialists to encourage providers to use the HealthCheck PHS form. Throughout the calendar year 2022, the regional HealthCheck Program Specialists provided education to provider clinic staff on the mental health screening standards and updates to the PHS forms.

Limitations of this study include its narrow focus on screening (and not services) and potential inconsistency in the ascertainment of mental health screening. While the analysis noted that a mental or behavioral health claim was submitted within 90 days increased from last year (42.2% in 2022, vs. 34.7% in 2021), of those children, youth, and young adults who received mental health screening during their EPSDT exams, the medical record review did not conclusively link said mental or behavioral health claims to specific referrals. As a result, no definitive assertion could be made that the mental or behavioral health claims within 90 days of the EPSDT exam are a result of the EPSDT exam. Claims data were also limited in timeliness, as payment could be sought for several months after a service was provided. As such, it should be noted that EPSDT exams and mental and behavioral health services could be underreported due to potential billing errors and delays in the submission of services claims for payment. Much thought and discussion went into the ascertainment of mental health screening. The authors drew on their own subject matter expertise as well as other OMCFH staff to develop the medical record review tool in Appendix B and the algorithm in Appendix C. However, the tool may have performed differently on the variety of EPSDT formats (medical records from different EMRs, paper charts, and HealthCheck PHS forms).

Results of the analysis will be disseminated to key stakeholders, including the state's medical (primary care) providers, to increase awareness and acceptance of mental health screening. Likewise, and to serve as a catalyst for ongoing conversations aimed at improving the uptake of mental health screening, infographics detailing comparative performance by specified HealthCheck region will be disseminated to enable providers to understand their region's performance versus other regions.

Appendix A. ICD-10 and Procedure Codes to Identify EPSDT Exams

Code	Description
ICD-10	
Z0000	Encounter for general adult medical examination w/o abnormal findings
Z0001	Encounter for general adult medical examination with abnormal findings
Z00110	Health examination for newborn under 8 days old
Z00111	Health examination for newborn 8 to 28 days old
Z00121	Encounter for routine child health exam with abnormal findings
Z00129	Encounter for routine child health exam without abnormal findings
CPT	
99381	Initial preventive medicine new patient <1 year
99382	Initial preventive medicine new patient age 1-4 yrs
99383	Initial preventive medicine new patient age 5-11 yrs
99384	Initial preventive medicine new patient age 12-17 yrs
99385	Initial preventive medicine new patient age 18-39 yrs
99391	Periodic preventive med established patient <1 yr
99392	Periodic preventive med established patient 1-4 yrs
99393	Periodic preventive med established patient 5-11 yrs
99394	Periodic preventive med established patient 12-17 yrs
99395	Periodic preventive med established patient 18-39 yrs
99461	Initial care per day, for evaluation and management of normal newborn infant seen in other than hospital or birthing center

Appendix B. Medical Record Review Tool
