Interview Teams

Survey Respondents

Executive Summary

On January 9, 2014, a chemical spill of 4-methylcyclohexanemethanol (MCHM) and a mixture of propylene glycol phenyl ethers (PPH), both known to have human health effects, contaminated the water supply of approximately 100,000 West Virginia households. The West Virginia Governor declared a State of Emergency, and the local water company issued a “Do Not Use” water order for nine counties on January 9, 2014, which was lifted for all counties by January 19, 2014. Despite lifting the order, the community’s use of public water systems, information sources, alternative sources of water, and perception of health impacts and public water system safety were unclear. Early on, the West Virginia Bureau for Public Health (WVBPH) requested assistance from the Centers for Disease Control and Prevention (CDC) to better understand two separate aspects of the spill:

- Symptoms experienced by community members in the immediate aftermath, and
- The effectiveness of the emergency response and how to improve it in the future.

In collaboration with WVBPH, CDC conducted separate investigations to address these two issues. To answer questions about symptoms experienced by household members immediately following the spill, we reviewed emergency department medical records and released the results in April:

<http://www.wvdhhr.org/Elk%20River%20Chemical%20Spill%20Health%20Effects%20-%20Findings%20of%20Emergency%20Department%20Record%20Review.pdf>. WVBPH also

analyzed non-emergency health providers’ reports of patient visits:

<http://www.dhhr.wv.gov/News/chemical-spill/Documents/PRFindings.pdf>. Both activities resulted in similar findings.

To address the emergency response, the Community Assessment for Public Health Emergency Response (CASPER) was conducted April 8-10 to help WVBPBPH evaluate the response and improve future responses. The CASPER health questions were not designed or intended to assess ongoing or current health issues related to the spill. This report describes the CASPER and its findings.

Specifically, the CASPER looked at: 1) assessing perceived impact of the chemical spill on households, 2) providing WVBPBPH with information on household water use and practices before, during, and after the “Do Not Use” order, and 3) assessing communications to identify effective approaches for the current and future events.

Interview teams were provided one full-day training and short briefings on safety and media inquiries prior to conducting interviews over three days in the field. A total of 171 household interviews were conducted. The major findings of the survey were as follows:

- The main method of communication about the chemical spill and implementation and lifting of the “Do Not Use” order was TV.
- The majority of households considered TV as the most reliable source of information about the chemical spill.
- Almost three-fourths of households did not have a 3-day alternative source of water supply for every person and pet in the household.

- The vast majority of households obtained an alternative source of water within less than one day of trying to obtain an alternative source of water.
- A potential challenge faced by households when trying to obtain alternative water sources was stores being out of water.
- Almost one in five households reported that a household member was told not to come into work because of the chemical spill.
- An estimated 21.7% of all households reported having one or more health issues (that is, symptoms that occurred between the time of the spill and the time they were interviewed) they felt were related to the chemical spill.
- An estimated 3.5% of all households reported having one or more mental health issues they felt were related to the chemical spill.
- Approximately 37.4% of households affected by the “Do Not Use” order used West Virginia American Water (WVAW) water during the “Do Not Use” order. More households used WVAW water after the “Do Not Use” order was lifted (approximately 66.8%) than during the “Do Not Use” order, and approximately 98.3% of households were using their household’s WVAW water at the time the questionnaire was administered.
- Approximately 36.1% of households affected by the “Do Not Use” order believe that WVAW is safe since the “Do Not Use” order was lifted.

Based on these findings, CDC has made recommendations to WVBPH to guide ongoing recovery efforts in the assessment area:

1. Focus on TV for public messaging during disasters when communication infrastructure remains intact, and also use multiple supplemental communication routes.
2. Encourage households to prepare a 3-day water supply to help them become prepared for future emergencies or disasters of any type.
3. Identify additional ways of providing alternative sources of water supplies in future emergencies to help reach household members without transportation or those who cannot leave work. For example, using volunteer agencies (e.g. American Red Cross) to deliver alternative water supplies.
4. Promote the availability of health and mental health resources to help affected community members access needed services.
5. Increase community education on current water safety to help alleviate consumer concerns.

BACKGROUND

On January 9, 2014, a chemical spill into the Elk River 1.5 miles upstream from the Kanawha County municipal water intake in Charleston, West Virginia contaminated the water supply of an estimated 100,000 West Virginia households (approximately 300,000 residents). The chemicals, 4-methylcyclohexanemethanol (MCHM) and a mixture of propylene glycol phenyl ethers (PPH), have known human health effects including skin, eye, and respiratory tract irritation. The West Virginia Governor declared a State of Emergency, and the local water company issued a “Do Not Use” water order for nine counties at 6:00 PM on the evening of January 9, 2014. The “Do Not Use” order was lifted at different times for different geographic areas, but it was lifted for all counties by January 19, 2014. The Agency for Toxic Substances and Disease Registry (ATSDR) in collaboration with the West Virginia Bureau for Public Health (WVBPH) conducted an Assessment of Chemical Exposure (ACE) investigation reviewing emergency department medical chart reviews of persons presenting because of exposure to MCHM and conducted a survey of hospitals that cared for patients exposed to MCHM (1).

However, the affected populations’ use of public water systems, information sources, alternative sources of water, and perception of health impacts and public water system safety remained unclear. To move the recovery process forward and improve response capability for future events, information on the aforementioned topics was urgently needed. The WVBPH requested assistance from CDC in conducting a Community Assessment for Public Health Emergency Response (CASPER) in the community affected by the “Do Not Use” order. On April 6, 2014, EIS Officers Ethan Fechter-Leggett and Joy Hsu, CDC staff Sherry Burrer, Rebecca Noe,

and Tesfaye Bayleyegn, and ORISE Fellow Nicole Nakata departed for Charleston, West Virginia. They joined WVBPH staff in conducting a rapid needs assessment in affected communities using CASPER methodology.

CASPER is an epidemiologic technique designed to provide household-based information about an affected community's needs in a timely, inexpensive, and representative manner used to assess public health needs in both disaster and non-disaster settings (2). This information can then be used to initiate public health action, to facilitate disaster planning, and to assess new or changing needs during the recovery period after a disaster. The specific goals of this CASPER were the following: 1) assess perceived impact of the chemical spill on households, 2) provide WVBPH with information on household water use and practices before, during, and after the "Do Not Use" order, and 3) assess communications to identify effective approaches for the current and future events.

METHODS AND MATERIALS

To accomplish these goals, WVBPH with assistance from CDC conducted a CASPER in West Virginia on April 8–10, 2014. WVBPH and CDC, in consultation with CDC's National Center for Environmental Health, Division of Environmental Hazards and Health Effects water subject matter expert, collaborated to develop a two-page data collection instrument (Appendix A). The survey instrument collected information on demographics; information sources about the chemical spill, "Do Not Use" order, and lifting of the "Do Not Use" order; alternative sources of water; household impact of the chemical spill; health and mental health issues since the spill

occurred on January 9, 2014, that household members felt were related to the chemical spill; and trust of the public water supply.

We used a two-stage cluster sampling methodology to select a representative sample of households to be interviewed within the sampling frame. The sampling frame was defined as the area of WVAW company's "Do Not Use" order, with a total of 122,339 housing units in the 2010 U.S. Census. First, using the Geographic Information Systems CASPER tool, 30 Census blocks (clusters) were selected with a probability proportional to the number of housing units within the clusters from the predefined sampling frame (GIS shapefiles of the "Do Not Use" order area were provided to WVBPH by WVAW). Second, interview teams used systematic random sampling to select seven households from each of the 30 selected clusters. Two-person interview teams were assigned to one or two clusters, provided with detailed maps from Google Earth of all of their cluster(s), instructed to select a random housing unit as the starting point, and then go to every n^{th} housing unit (where "n" is the total number of housing units in the cluster divided by seven) to select the seven housing units to interview. Teams were instructed to make three attempts at each selected household before replacement.

CDC provided the interview teams and additional trainees with an eight-hour training on Monday, April 7, 2014 on the overall purpose of CASPER, household selection methods, mapping, questionnaire content, interview techniques, safety, and logistics. On Tuesday, April 8, 2014, CDC provided the interview teams with a one-hour refresher on household selection methods and data collection and provided answers to questions raised the previous day

regarding questionnaire content. The interview teams also received a safety training from Kanawha County Sheriff's Department and a media briefing by WVBPH. There were a total of 18 teams on the first and second interview days and 4 teams on the third interview day. All interview teams had at least one state public health staff person, with assistance provided by West Virginia University School of Public Health students and CDC staff. Teams conducted interviews between 2:00pm and 7:30pm EST. Teams attempted to conduct seven interviews in each of the 30 selected clusters, with a goal of 210 total interviews. All potential respondents approached were given a copy of the consent sheet containing contact telephone numbers for WVBPH and educational material from the Substance Abuse and Mental Health Services Administration (SAMHSA) Disaster Distress Helpline. Documents available for handout to all interested persons were the SAMHSA Disaster Distress Helpline brochure; a list of community behavioral health center contacts prepared by WVBPH; a list of additional websites and phone numbers to obtain more information on the governor's state of emergency, the role of CDC and WVBPH in the response efforts, poison center and National Disaster Distress Helpline contact information, and water testing through private laboratories; and a signed letter from the West Virginia Commissioner and State Health Officer for interviewer identity verification. Eligible household respondents were 18 years of age or older and resided in the selected household. Additionally, the interviewers were instructed to complete confidential referral forms whenever they encountered urgent physical or mental health needs.

We conducted weighted cluster analysis to report the projected number and percent of households with a particular response in the sampling frame. We calculated a weight for each

interview to account for the probability that the responding household was selected. Data analysis was conducted in EpiInfo 7.1.3 (CDC, Atlanta, 2013) to calculate the unweighted frequencies, unweighted percentages with 95% confidence intervals, weighted frequencies with 95% confidence intervals, and weighted percentages with 95% confidence intervals. Most survey questions were asked of all households, regardless of “Do Not Use” order status (Appendix A, questions highlighted in yellow); however some questions were asked of only WVAW customers affected by the “Do Not Use” order (Appendix A, questions in white).

RESULTS

The 18 interview teams completed 171 surveys over three days for an overall completion rate of 81.4% (Table 1). Teams completed interviews in 41.4% of houses approached. Of the households with an eligible participant answering the door, 63.3% completed an interview.

For all results, unless otherwise stated, frequencies and percentages in the text represent weighted frequencies and weighted percentages. For those questions asked of only WVAW customers affected by the “Do Not Use” order, we have a smaller response number for those questions ($n \leq 128$); for each of these question results, marked with an asterisk, we provide the weighted point estimate, but these should be interpreted as approximate.

Household demographics (Tables 2–7)

The majority (79.7%) of households were single family homes, followed by mobile homes (12.8%). Almost 81% of households were owned. The majority (87.9%) of households had at

least one female in the household, and of households with at least one female, at least one pregnant female was reported in 8 interviewed households (projected number of households: 5,127; weighted percent: 5.2% [1.4%–9.0%]*). Over three-fourths (77.4%) of households had at least one person 18–64 years old, and only 6 interviewed households (projected number of households: 3,728; weighted percent: 3.2% [0.3%–6.0%]*) had at least one person less than two years old. Almost all households (99%) identified the ethnicity of household members as not Hispanic/Latino. The most common race identified of household members was white (93.6%), followed by black (4.8%). Of households reporting the highest level of education completed by anyone in the household, 35.7% reported some college and 33.7% reported a bachelor’s or advanced degree. More than half of households reported a total yearly income of \$25,000–\$49,999 (25.9%) or \$50,000–\$99,999 (25.4%). Of all households, 62.1% reported ownership of at least one pet; 73.8% (65.1%–82.5%)* of these households owned dogs and 58.1% (47.9%–68.3%)* owned cats.

Of all households within the sampling frame, 78.5% were WVAW customers. However, 75.0% of all households reported being affected by the “Do Not Use” order; the remaining 3.5% mentioned their water came from a different WVAW plant than the plant affected by the chemical spill and thus their household was not affected by the “Do Not Use” order.

Communications (Tables 8–17, Figures 2–5)

* Weighted point estimate to be interpreted as approximate.

Almost 80% of households first learned about the chemical spill on January 9, 2014, the same day the chemical spill occurred. By the next day, January 10, 2014, a total of 93.3% of households had learned about the chemical spill. Of households that reported they learned of the chemical spill on January 9, 2014, the most common time was in the evening (defined as 5:00PM–11:59PM), while of those that reported learning on January 10, 2014, the most common time was morning (defined as 12:00AM–11:59AM). Most households (54.3%) first learned about the chemical spill from TV. The next most common ways households learned about the chemical spill, though substantially less than the percentage that learned from TV, were face-to-face talking to people, commonly referred to as word of mouth (12.5%, most commonly a co-worker), phone call on cell phone (9.3%, most commonly family/relative), and phone call on land line (8.2%, most commonly family/relative). The main sources from which households received information about the chemical spill were TV (83.1%), word of mouth (49.5%), and newspaper (45.6%). Only 25% of households cited WVAW website as a source of information about the chemical spill. The majority (58.0%) of households considered TV as the most reliable source of information about the chemical spill. The next most common information sources considered reliable, though substantially less than the percentage that considered TV the most reliable, were internet (not WVAW website) (8.5%), word of mouth (6.7%), social media (5.6%), and WVAW website (5.1%). Of all households, regardless of “Do Not Use” order status, 14 interviewed households (8.2% of interviewed households) stated that there was no reliable source of information.

Of households affected by the “Do Not Use” order, 65.9% (55.9%–75.8%)* learned about the “Do Not Use” order on January 9, 2014, the day WVAW issued the order, and considerably fewer households learned on January 10, 2014 or after. The most common way households learned about the “Do Not Use” order was from TV (52.5% [44.6%–60.5%]*), followed by word of mouth (13.8% [8.3%–19.3%]*) and phone call on cell phone (10.0% [3.9%–16.0%]*), both most commonly from family/relative. Of households affected by the “Do Not Use” order that tried to get an alternative source of water, the top sources of information about water distribution sites were TV (38.1% [25.3%–50.9%]*), word of mouth (28.2% [19.5%–36.9%]*), radio (13.8% [7.1%–20.6%]*), and social media (12.1% [6.0%–18.3%]*).

Of households affected by the “Do Not Use” order, 70.5% (59.9%–81.0%)* did not know the date when the household first learned the “Do Not Use” order for their household was lifted. Television was the most common way households learned the “Do Not Use” order for their household was lifted (52.2% [42.4%–62.0%]*), followed by map on WVAW website (17.3% [10.8%–23.7%]*) and phone call on land line (8.5% [2.4%–14.7%]*), most commonly from the WVAW company. Television was also the most common source of information about household plumbing flushing instructions (58.0% [48.2%–67.8%]*). Other sources of flushing instructions were WVAW website (36.9% [27.0%–46.8%]*) and word of mouth (12.3% [5.6%–19.0%]*); all other sources of flushing instructions accounted for less than 14% of households each. Of households that received plumbing flushing instructions, 94.1% (89.4%–98.8%)* thought they were easy to read and understand.

Preparedness (Tables 18–19)

Water sources in the household at the time the household first heard about the chemical spill were WVAW (77.5%; note that 2 of 132 households that were WVAW customers reported not having WVAW in the household at the time the household first learned about the chemical spill), purchased water (e.g., bottled water) (51.7%), other public water supply (17.8%), and well water (1.5%). Almost three-quarters (74.4%) of households did not have a 3-day alternative source of water supply for each household member and pet in the household. About 14.1% of households had a 3-day alternative water supply for people only.

Alternative sources of water (Tables 20–27, Figures 6–8)

The vast majority (89.7% [81.8%–98.2%]^{*}) of households affected by the “Do Not Use” order reported using purchased water (e.g., bottled water) during the “Do Not Use” order; bottled water from a water distribution site (56.3% [40.8%–71.7%]^{*}) and water from a friend or relative (42.5% [30.4%–54.6%]^{*}) were also commonly used water sources during the “Do Not Use” order. Almost all households affected by the “Do Not Use” order (97.5% [94.6%–100.0%]^{*}) reported trying to get an alternative source of water. Of households that tried to obtain an alternative source of water, at least half first attempted to get an alternative source of water on either January 9, 2014 (36.1% [26.4%–45.8%]^{*}) or January 10, 2014 (40.0% [27.4%–52.6%]^{*}) and first successfully obtained an alternative source of water on January 9, 2014 (29.4% [20.3%–38.5%]^{*}) or January 10, 2014 (43.2% [30.2%–56.2%]^{*}). The majority (83.6% [77.6%–89.6%]^{*}) of households successfully procured an alternative source of water the same day they attempted to obtain it. Most households (72.8% [63.5%–82.1%]^{*}) tried to acquire an alternative source of

water from a large store or grocery (e.g., Wal-Mart, Kroger). Other places where households tried to get an alternative source of water were a water distribution site in the household's town of residence (49.6% [33.8%–65.3%]^{*}) and water from a friend or relative (41.3% [28.1%–54.5%]^{*}). Most households (70.8% [60.7%–80.8%]^{*}) were able to obtain water from a large store or grocery, while other places from where households were commonly able to obtain water were a water distribution site in the household's town of residence (47.3% [32.4%–62.2%]^{*}) and water from a friend or relative (45.0% [32.3%–57.7%]^{*}). More households reported not travelling outside of the affected area to get an alternative source of water (50.4% [38.2%–62.5%]^{*}) than those that did travel outside of the affected area to purchase water (16.9% [9.4%–24.4%]^{*}); however, some households (33.9% [20.5%–47.2%]^{*}) reported travelling and getting water from a friend or relative. The most common length of time households reported being without any alternative source of drinking water was “never without an alternative source of drinking water” (55.0% [42.0%–67.9%]^{*}), followed by less than one day (29.2% [18.7%–39.7%]^{*}); other lengths of time of one day or more were much less frequently reported. Of households reporting being without an alternative source of drinking water for one or more days, 47.9% (19.5%–76.4%)^{*} cited the reason was that the store was out of water.

Household impact (Tables 28–31)

Of households affected by the “Do Not Use” order, the majority (81.8% [73.7%–90.0%]^{*}) reported not staying overnight outside of the home for one or more days to have access to an alternative source of water, and less than 7% paid money to stay elsewhere (e.g., hotel). Among all households, regardless of the household's “Do Not Use” order status, 21.2%

reported their child(ren)s' school or daycare closed due to the chemical spill; however, school or childcare closures did not affect 65.8% of households, because they either did not have children or their children did not go to school or daycare. Of households reporting school or daycare closure, less than half reported they either took off work to care for their children (19.2% [5.1%–33.4%]^{*}), or someone was paid to supervise them (4.7% [0.0%–11.4%]^{*}). About 10% of households owned a business, and only 4.8% (0.0%–15.3%)^{*} of those households with a business reported that the business was ordered to close as a result of the chemical spill. Of all households, 18.1% claimed any member was told not to come into work because of the chemical spill, 11.3% with paid leave and 6.8% with unpaid leave.

Health (Tables 32–36)

Of all households, regardless of the household's "Do Not Use" order status, 21.7% reported anyone in the household having health issues they felt were related to the chemical spill. Of all households, regardless of the household's "Do Not Use" order status, that reported health issues they felt were related to the chemical spill, 89.6% (78.7%–100.0%)^{*} stated the age of affected household members was 18 years of age or older, and 14.9% (3.4%–26.5%)^{*} stated the age as less than 18 years old. Symptoms reported included rash (53.2% [32.9%–73.5%]^{*}), skin irritation/itching (41.6% [20.6%–62.6%]^{*}), respiratory illness/cough (16.1% [2.6%–29.6%]^{*}), diarrhea (14.8% [2.0%–27.5%]^{*}), and nausea (13.1% [1.5%–24.6%]^{*}). When asked where medical care was sought, the most common response was "did not seek medical care" (54.2% [39.8%–68.6%]^{*}). Of those who did not seek medical care, the most common reason was because the health issues were not serious enough (66.8% [42.2%–91.4%]^{*}). Of all households

regardless of “Do Not Use” order status, 3.5% reported anyone in the household having experienced any mental health issues they felt were related to the chemical spill. Of households reporting mental health issues they felt were related to the chemical spill, 83.7% (41.3%–100.0%)* mentioned anxiety or stress. Of households reporting any pet ownership, 2.2% (0.0%–5.3%)* reported pets having illness they felt was related to the chemical spill.

Public water supply: behaviors and beliefs (Tables 37–40)

Of households affected by the “Do Not Use” order, 37.4% (26.7%–48.2%)* reported using WVAW water during the “Do Not Use” order. Of these households, the most common WVAW water use during the “Do Not Use” order was showered/bathed (80.1% [71.4%–88.8%]*). Other uses included washed hands (45.9% [28.8%–63.0%]*), washed clothes (37.7% [21.7%–53.6%]*), ran dishwasher/hand-washed dishes (32.2% [15.5%–48.8%]*), and brushed teeth (31.8% [18.9%–44.6%]*). Less than half of households participated in consumption behaviors during the “Do Not Use” order; 26.9% (14.3%–39.4%)* ate or drank food prepared with water and 26.6% (14.1%–39.0%)* drank the water. Of the households reporting any pet ownership, 19.2% (6.4%–32.0%)* gave WVAW water to pets during the “Do Not Use” order.

Of households affected by the “Do Not Use” order, 66.8% (57.3%–76.3%)* reported using WVAW water after the “Do Not Use” order was lifted but before the end of January; households were specifically asked about this time period in order to describe water uses soon after the “Do Not Use” order was lifted. During this time, WVAW water uses of these households included showering/bathing (91.8% [85.6%–98.1%]*), hand washing (74.2% [62.1%–

86.3%^{*}), and brushing teeth (36.3% [22.6%–50.0%]^{*}). Both washing clothes (93.8% [88.3%–99.3%]^{*}) and dishwashing (67.6% [54.8%–80.4%]^{*}) uses were more than during the “Do Not Use” order.

Of households affected by the “Do Not Use” order, 98.3% (95.9%–100.0%)^{*} reported using their household’s WVAW water at the time the questionnaire was administered. The vast majority of these households reported using their household’s WVAW water at the time the questionnaire was administered for showering/bathing (97.2% [94.0%–100.0%]^{*}), washing clothes (95.4% [90.9%–99.9%]^{*}), hand washing (94.2% [90.1%–98.3%]^{*}), and dishwashing (90.6% [84.3%–96.8%]^{*}). Using the water for cooking at the time the questionnaire was administered (50.7% [41.0%–60.4%]^{*}) was higher than during the “Do Not Use” order and after the “Do Not Use” order was lifted but before the end of January. Less than half of the households (33.5% [26.6%–40.4%]^{*}) reporting using their household’s WVAW water for drinking at the time the questionnaire was administered. Of households reporting any pet ownership, 55.0% (42.6%–67.4%)^{*} reported giving WVAW water to pets at the time the questionnaire was administered.

Of households affected by the “Do Not Use” order, 85.6% (79.8%–91.3%)^{*} reported that before the chemical spill, they believed the WVAW water supply their household received was safe. When asked, “Since the ‘Do Not Use’ order was lifted, do you believe that the WVAW water supply your household receives is safe?” only 36.1% (27.8%–44.4%)^{*} replied “Yes.”

Discussion

These data represent the CASPER surveys conducted in West Virginia on April 8–10, 2014 during the recovery phase after a chemical spill into the Elk River. We anticipated the vast majority of included households would be WVAW customers affected by the “Do Not Use” order and that the proportion of households utilizing another public water supply would be very small. Because only 75.0% of all households within the sampling frame were WVAW customers affected by the “Do Not Use” order, this resulted in having a smaller sample size for those questions asked only of WVAW customers affected by the “Do Not Use” order. However, this may also mean that 25% of all households within the sampling frame were either not WVAW customers or WVAW customers that were not affected by the “Do Not Use” order (due to their water coming from a different WVAW plant), and hence were not faced with concerns of seeking, obtaining, and using alternative sources of water and conducting household plumbing flushing. We assume that responding households are representative of households within the sampling frame.

Seven topic areas formed the basis of this CASPER: 1) demographics, 2) communications, 3) emergency water preparedness, 4) obtainment of alternative sources of water, 5) household impact of the chemical spill, 6) health and mental health issues felt to be related to the chemical spill, and 7) public water supply behaviors and beliefs.

Demographics of the sampling frame were similar to the most recent census estimates of the counties included in the sampling frame, which supports the sample of interviewed households

being representative of the sampling frame (3).

It appears that people knew about the chemical spill and “Do Not Use” order very quickly, most on the day of the chemical spill. The main methods of communication about the spill and “Do Not Use” order status included TV and calling on cell phone and land lines, which is consistent with a disaster or emergency that does not affect communication infrastructure. Word of mouth was also a common method of communication about the chemical spill and “Do Not Use” order, which may reflect the day of the week the chemical spill occurred (Thursday) and time of day most people found out about the chemical spill (i.e., evening of the day the chemical spill was announced and the following morning). In contrast, radio, social media, and the internet were more common sources of information about water distribution sites than they were for communicating information about the chemical spill, “Do Not Use” order, or lifting of the “Do Not Use” order. Again, this is consistent with methods of information sharing when communication infrastructure remains intact.

Almost three-fourths of households were not adequately prepared for a lack-of-water crisis and did not have a 3-day alternative source of water supply while only 14.1% had a 3-day water supply for each person in the household and were therefore adequately prepared (4). While not directly comparable, these results seem considerably lower than the 2009 Federal Emergency Management Agency (FEMA) Personal Preparedness in America report that found 53% of individuals reported “having supplies set aside in their home to be used only in the case of a disaster,” and of those, 73% reported those supplies included bottled water (5). The vast

majority of households obtained an alternative source of water within less than one day of trying to obtain an alternative source, and of those who had difficulty obtaining an alternative source of water, stores being out of water was a commonly cited reason. The percentage of households that reporting using purchased water (e.g. bottled water) during the “Do Not Use” order may be higher than the percentage of households reporting trying to get an alternative source of water from a large store or grocery, because some households reported having water delivered to them (for example, from church or family members) and may not have considered this delivery of water an attempt to obtain an alternative source of water. In terms of household impact, almost one in five households claimed any household member was told not to come into work because of the chemical spill.

Less than one-quarter of households reported health issues they felt were related to the chemical spill, and of those, the symptoms reported were similar to what have been reported in the ACE investigation (1) and to the National Poison Data System (E. J. Scharman, Pharm.D, email communication, May 2014) (6). If household respondents did not consider stress or anxiety as a mental health issue, our study may have underestimated mental health issues that households felt were related to the chemical spill. Symptoms that occurred between the time of the spill through the time of the household interview were captured. The interview did not ask for dates when symptoms occurred or when they were resolved.

The vast majority of households were using WVAW water at the time the questionnaire was administered for many daily activities, including showering/bathing and washing clothes,

dishes, and hands; however, it appears that less than half of households were using the water for drinking at the time the questionnaire was administered. It is important to note that we do not know baseline prevalence of drinking WVAW water before the chemical spill. However, we do know that the majority thought WVAW water was safe before the chemical spill and less than half think it is safe since the “Do Not Use” order has been lifted.

Recommendations

On the basis of this CASPER, we make the following recommendations to guide ongoing recovery efforts in the assessment area:

1. Public messaging should focus on TV, while also employing multiple supplemental communication routes, during disasters where communication infrastructure is intact.

Our results indicate that the most common source of information about the chemical spill and implementation and lifting of the “Do Not Use” order was TV, and the majority of households considered TV as the most reliable source of information about the chemical spill. In addition to TV, this community also utilized a wide range of communication strategies for information about the chemical spill, “Do Not Use” order status, and water distribution sites. Especially in disasters and emergencies where communication infrastructure remains intact, projecting consistent communication objectives through TV as well as multiple other supplemental communication routes could help reach a broad audience.

2. Promote water preparedness for all households.

Encouraging households to prepare a 3-day water supply for each person and pet in the

household would promote households taking an active role in the recovery process and help them become prepared for future disasters. The website Ready.gov recommends storing at least one gallon of water per person per day for drinking and sanitation; the website also details water preparedness recommendations for special populations (e.g. children, nursing mothers) and climates as well as methods of preparing and storing water (4).

3. Identify ways to provide alternative water supplies in future emergencies.

While the majority of households obtained an alternative water source the same day they attempted to obtain it, a potential challenge of households reporting being without an alternative source of drinking water for one or more days was because a store was out of water, among other reasons. Despite information sharing about water distribution sites, some households were without an alternative source of drinking water for one or more days because they could not locate distribution sites or the distribution site was out of water. Additional methods of providing alternative sources of water, such as leveraging community centers, employers, volunteer agencies, and schools, as well as delivery of water to some homes could help some households obtain water in future emergencies, especially those that cited “no transportation” or “could not leave work” as reasons for being without water.

4. Publicize health and mental health resources.

Although less than one-quarter of households reported health issues they felt were related to the chemical spill and 3.5% reported mental health issues they felt were related to the chemical spill, those who are experiencing health or mental health issues need access to appropriate

services. Promotion of the availability of resources such as local behavioral health centers can help affected community members access the needed services.

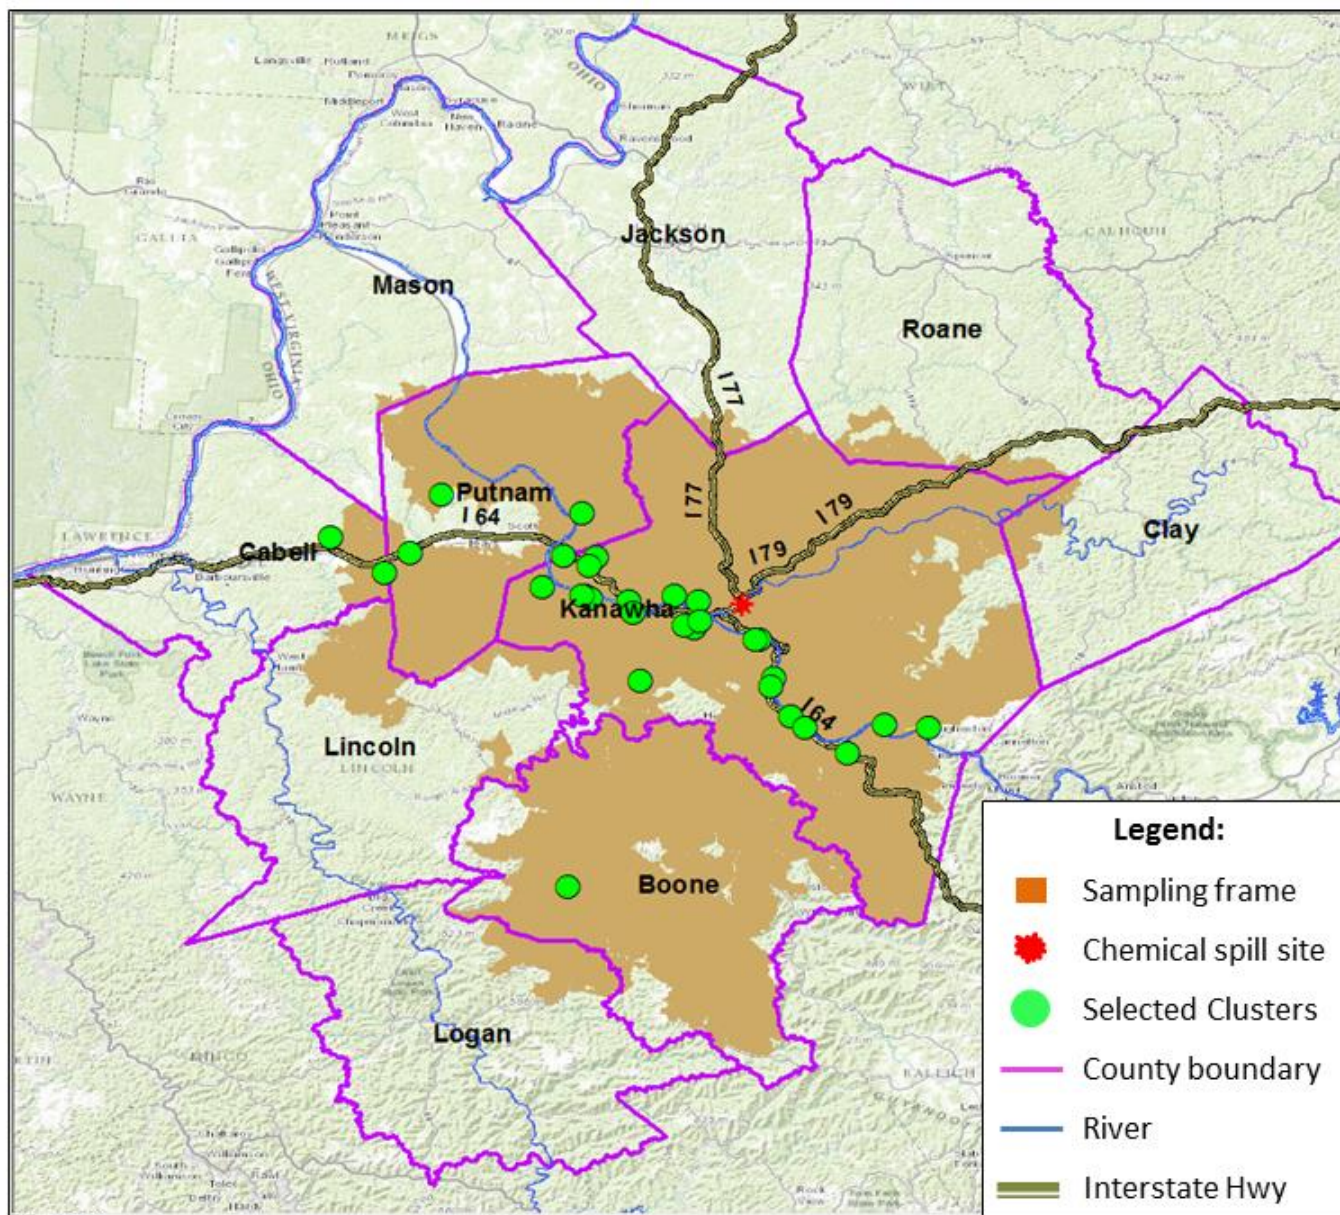

5. Increase community education on current safety.

Our results indicate that less than half of the households affected by the “Do Not Use” order believe WVAW water is safe since the “Do Not Use” order was lifted. Public messaging, especially through the most trusted source of information (television), might help increase community education about current water safety and alleviate some consumer concerns.

This set of questions is about messaging and source(s) of water during the chemical spill into the Elk River that occurred on Thursday, January 9th, 2014.

Q7. Are you a West Virginia American Water (WVAW) customer? Yes No D/K Ref

Q8. When did anyone in your household first learn about the chemical spill into the Elk River? (show calendar)
 Date: 01/___/2014 Time of day: Morning Afternoon Evening D/K Ref N/A

Q9. How did your household FIRST LEARN about the chemical spill? Choose only ONE.
 Phone call on land line Phone call on cell phone Text message Face-to-face talking to people Social media (e.g. Facebook, Twitter)
 Radio TV Newspaper Internet Other: _____ D/K Ref N/A

Q9a. From whom or where did your household FIRST LEARN about the chemical spill (by the method in the previous question)? Choose only ONE.
 WVAW Friend/neighbor Family/relative Co-worker Stranger Internet (specify site): _____
 Radio (specify station): _____ TV (specify station): _____ Newspaper(specify): _____ Other: _____ D/K Ref N/A

Just to verify, you FIRST LEARNED about the chemical spill from (Q9a answer) by (Q9 answer), is this correct?

Q10. Please list all sources of water that you had in your household at the time you first heard about the chemical spill. CATA.
 WVAW Other public water supply Well water Purchased water (e.g. bottled water) Other: _____ D/K Ref

Q10a. Previous to the spill, was there a 3-day alternative source of water supply (for drinking, preparing food, and hygiene) for each household member and pet at your home (1 day supply = 1 gallon/person or pet/day)? Yes, for people only Yes, for people and animals No D/K Ref

Q11. Where have members of your household received information about the chemical spill since the event occurred? CATA. D/K Ref
 Word of mouth Social media Radio TV Newspaper WVAW website Internet (not WVAW website) Other: _____ N/A

Q11a. In your opinion, what was the most reliable source for information about the chemical spill? Choose only ONE. D/K Ref
 Word of mouth Social media Radio TV Newspaper WVAW website Internet (not WVAW website) Other: _____ N/A

Q12. When did anyone in your household first learn the 'do not use' order was in effect for your household? Date: 01/___/2014 D/K Ref N/A

Q13. How did your household FIRST LEARN about the 'do not use' order for your household? Choose only ONE.
 Phone call on land line Phone call on cell phone Text message Face-to-face talking to people Social media (e.g. Facebook, Twitter)
 Radio TV Newspaper Internet Other: _____ D/K Ref N/A

Q13a. From whom or where did your household FIRST LEARN about the 'do not use' order for your household? Choose only ONE.
 WVAW Friend/neighbor Family/relative Co-worker Stranger Internet (specify site): _____
 Radio (specify station): _____ TV (specify station): _____ Newspaper(specify): _____ Other: _____ D/K Ref N/A

Just to verify, you FIRST LEARNED about the 'do not use' order for your household from (Q13a answer) by (Q13 answer), is this correct?

Q14. Did anyone in your household use WVAW in your home at any point during the time that the 'do not use' order was in effect for your household (other than flushing the toilet or trying to put out a fire)? Yes No D/K Ref N/A

IF YES to Q14 → Q14a. How was the water used? CATA.
 Drank the water Washed hands Brushed teeth Ate or drank food prepared with water Washed clothes Watered plants
 Ran dishwasher/hand-washed dishes Gave water to pets Showered/bathed in water Other _____ D/K Ref N/A

Q15. After the chemical spill, did anyone in your household try to get water from an alternative source to your WVAW water?
 Yes No D/K Ref N/A

IF YES to Q15 → Q15a. When did anyone from your household FIRST ATTEMPT to get an alternative source of water for the household?
 Date: 01/___/2014 D/K Ref N/A

IF YES to Q15 → Q15b. When did anyone from your household FIRST SUCCESSFULLY get an alternative source of water for the household?
 Date: 01/___/2014 D/K Ref N/A

IF YES to Q15 → Q15c. What other water source(s) did your household USE during the 'do not use order?' CATA.
 Purchased water (e.g. bottled water) Filled container(s) at water distribution site Well water on premises Rainwater
 Water from a friend or relative Bottled water from a water distribution site Other: _____ D/K Ref N/A

IF YES to Q15 → Q15d. Where did your household TRY TO GET alternative source(s) of water from during the 'do not use order?' CATA.
 Large store or grocery (e.g. Wal-Mart, Kroger) Water distribution site in my town of residence Well water on premises
 Nearby convenience store or gas station Water distribution site outside of my town of residence Rainwater
 Water from a friend or relative Other: _____ D/K Ref N/A

IF YES to Q15 → Q15e. Where was your household ABLE TO GET alternative source(s) of water during the 'do not use order?' CATA.
 Purchased from large store or grocery (e.g. Wal-Mart, Kroger) Water distribution site in my town of residence Well water on premises
 Purchased from nearby convenience store or gas station Water distribution site outside of my town of residence Rainwater
 Water from a friend or relative Other: _____ D/K Ref N/A

IF YES to Q15 → Q15f. If anyone in your household visited a water distribution site, how did you find out about the location? CATA.
 Received phone call on land line Received phone call on cell phone Text message Face-to-face talking to people D/K
 Social media (e.g. Facebook, Twitter) Radio TV Newspaper Internet Other: _____ Ref N/A

IF YES to Q15 → Q15g. Did anyone in your household travel outside of the area affected by the chemical spill to get alternative source(s) of water during the 'do not use' order? CATA. Yes, to purchase water Yes, got water from friend/relative Yes, but did not get water No D/K Ref N/A

Q16. How long was your household without ANY alternative source of drinking water during the 'do not use' order?
 My household was never without an alternative source of drinking water Less than 1 day # _____ days D/K Ref N/A

Q16a. If your household was without an alternative source of drinking water for one or more days, what was the reason for this? CATA.
 Not enough money to purchase water No transportation Store was out of water Distribution site was out of water
 Could not locate distribution site Distribution site changed Distribution site closed Did not have clean containers for filling
 Could not leave work Other _____ D/K Ref N/A

Continued on the back page →

Public reporting burden of this collection of information is estimated to average 20 minutes per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. An agency may not conduct or sponsor, and a person is not required to respond to a collection of information unless it displays a currently valid OMB control number. Send comments regarding this burden estimate or any other aspect of this collection of information including suggestions for reducing this burden to CDC/ATSDR Reports Clearance Officer; 1600 Clifton Road NE, MS E-11 Atlanta, Georgia 30333; ATTN: PRA (0920-0008)

This next set of questions is about the impact of the chemical spill on your household.

Q17. Did anyone in your household stay overnight outside of your home for one or more days in order to have access to an alternative source of water?
 Yes, paid money to stay elsewhere (e.g. hotel) Yes, but did not have to pay (e.g., stayed with a friend) No D/K Ref N/A

Q18. If you have children in your household in daycare or grades K-12, did any of their schools or daycares close due to the chemical spill?
 Yes No D/K Ref N/A (children do not go to school or daycare) N/A (do not have children)

IF YES TO Q18 → Q18a. Did anyone in the household have to take off from work to care for them? CATA.
 Yes No, they did not require supervision No, unpaid friend/relative was able to supervise them
 No, someone was paid to supervise them Other: _____ D/K Ref N/A

Q19. Does anyone in the household own a business? Yes No D/K Ref
IF YES TO Q19 → Q19a. Was the business ORDERED to close as a result of the chemical spill? Yes No D/K Ref N/A

Q20. Was any member of your household told not to come in to work because of the chemical spill?
 Yes, with paid leave Yes, with unpaid leave No Other: _____ D/K Ref N/A

This next set of questions is about the health of members of your household.

Q21. Since the chemical spill on January 9th (show calendar), did anyone in your household have any health issues they felt were related to the chemical spill? Yes No D/K Ref

IF YES TO Q21 → Q21a. How many people in your household feel they had health issues related to the chemical spill?
 # _____ less than 18 years # _____ 18 years old or older D/K Ref N/A

IF YES TO Q21 → Q21b. What type of health issues did you or your household members have? (Do NOT read list aloud; wait for interviewee to list & CATA)
 Nausea Vomiting Abdominal pain Diarrhea Rash Skin irritation/itching Headache
 Eye irritation/pain Sore throat Respiratory illness/cough Other: _____ D/K Ref N/A

IF YES TO Q21 → Q21c. When did the symptom(s) start? CATA.
 Before the 'do not use' order During the 'do not use' order After the 'do not use' order was lifted Other: _____ D/K Ref N/A

IF YES TO Q21 → Q21d. Where was medical care sought? CATA.
 Did not seek medical care Primary care physician/provider Urgent care Emergency room
 Was admitted to the hospital Other: _____ D/K Ref N/A

IF YES TO Q21 → Q21e. If household members did NOT seek medical care, what were reason(s) for not doing so? CATA.
 Health issues were not serious enough to seek medical care No insurance No transportation
 Concerned about the cost of seeking medical care Other: _____ D/K Ref N/A

Q22. Since the chemical spill, has anyone in your household experienced any mental health issues they felt were related to the chemical spill?
 Yes No D/K Ref

IF YES TO Q22 → Q22a. What kinds of mental health issues? (Do NOT read list aloud; wait for interviewee to list, then CATA)
 Agitated behavior Anxiety or stress Difficulty concentrating Loss of appetite Trouble sleeping/nightmares Alcohol/drug use
 Witnessed or experienced violence Other: _____ D/K Ref N/A

Q23. Did any of your pets have any illness that you felt was related to the chemical spill? Yes No D/K Ref N/A

IF YES TO Q23 → Q23a. What type of symptoms did your pets have? (Do NOT read list aloud; wait for interviewee to list, then CATA)
 Vomiting Diarrhea Rash Skin irritation/itching Eye irritation Respiratory illness/cough Other: _____ D/K Ref N/A

IF YES TO Q23 → Q23b. Did you seek veterinary care for your animal(s)? Yes No D/K Ref N/A

This next set of questions is about your household after the 'do not use order' was lifted.

Q24. When did anyone in your household first learn that the 'do not use' order was lifted for your household? Date: 01/_____/2014 D/K Ref N/A

Q25. How did your household FIRST LEARN that the 'do not use' order was lifted? Choose only ONE.
 Phone call on land line Phone call on cell phone Text message Face-to-face talking to people Social media (e.g. Facebook, Twitter)
 Radio TV Newspaper Map on WVAW website Internet (other than WVAW website) Other: _____ D/K Ref N/A

Q25a. From whom or where did your household FIRST LEARN that the 'do not use' order was lifted? Choose only ONE.
 WVAW Friend/neighbor Family/relative Co-worker Stranger Internet (specify site): _____
 Radio (specify station): _____ TV (specify station): _____ Newspaper(specify): _____ Other: _____ D/K Ref N/A

Just to verify, you FIRST LEARNED that the 'do not use' order was lifted from (Q25a answer) by (Q25 answer), is this correct?

Q26. How did your household receive information on how to flush your household plumbing system? CATA.
 Phone call on land line Phone call on cell phone Text message Face-to-face talking to people Social media (e.g. Facebook, Twitter)
 Radio TV Newspaper WVAW website Internet (other than WVAW website) Did not receive information
 Other: _____ D/K Ref N/A

Q27. Was the information on how to flush your home plumbing system easy to read and understand? Yes No D/K Ref N/A

Q28. After the 'do not use' order was lifted, did anyone in your household begin using water from WVAW before the end of January?
